depicting various periodontal conditions. Here's a stepbystep approach:

- 1 Assess bone levels: Look for the alveolar bone crest. Compare it to the cementoenamel junction (CEJ) to determine bone loss.
- 2 Identify furcation involvement: Carefully examine the areas between the roots of multi rooted teeth for signs of bone loss.
- 3 Evaluate lamina dura: The lamina dura is a thin radiopaque line surrounding the root. Loss of lamina dura indicates bone resorption.
- 4 Look for periodontal pockets: While not directly visible on radiographs, the presence of bone loss often indicates the presence of periodontal pockets.
- 5 Compare to previous radiographs: Tracking bone loss over time is crucial in monitoring disease progression or response to treatment.

Visual Aid: Imagine a grayscale image. The darker areas represent bone loss, while the lighter areas represent healthy bone. Practice interpreting different images to build your expertise.
